Solution Design

Technologies

For this test, the following technologies were used:

- Airflow – Orchestrate tasks
- Python – Develop tasks
 - Pandas – Extract, Transformation and Load data
 - Requests – Get data from API
- Docker – Used to encapsulate the environment

Prerequisites

- Docker desktop

Instructions to Setup

1. Clone the git repository through the command:
 - git clone <https://github.com/MathBosco/BreweriesCase.git>
2. Open Docker desktop
3. Open folder from cloned repository in cmd
4. Init Docker Build through the command:
 - docker-compose up airflow-init
5. After the previous command is finished, enter the next command to start Docker:
 - docker-compose up
6. Docker will be ready to access when the following line appears in the terminal:
7. After the previous command is finished, open your browser and put this address on the search bar:
 - localhost:8080
8. To authenticate in Air Flow use:
 - **user:** airflow
 - **password:** airflow
9. To validate the project configuration, check that the folder structure is in the following format:
10. That's it, you can now use the application! To learn more about how to perform the tasks, see the document: **docs/BreweriesCase.docx**
11. To close Docker, use the command:
 - docker-compose down
